Surgical Release Form for
Superficial Digital Flexor Tendon Luxation Repair

Owner: _______________________ Patient: _______________________ Date: ____________

Referring Hospital: _________________________ Veterinarian: _________________________

Surgery to be performed: ________________________________

I have discussed the aforementioned surgery and the importance of pre-surgical blood testing with the referring veterinarian. I understand that there are risks and hazards involved with the recommended surgical procedure, including anesthetic risk. I realized that no guaranty or warranty can ethically or professionally be made regarding the results or cure.

I authorize the surgeons and/or associates (Drs. Harper, Franklin and Keoghan) of Texas Specialty Veterinary Services, PLLC to perform surgery on my pet. I am also aware that Dr. Harper and Dr. Keoghan are board certified in large animal surgery only but have retrained in small animal surgery as well, therefore, offers their services to small animal clients and their animals. I have also been made aware that Dr. Franklin is small animal surgery residency trained, but has not become board certified at this time. At this time Dr. Franklin’s title is Practice Limited to Surgery. I understand that there are other board-certified surgeons in small animal available in the area.

Your pet has been diagnosed with a luxating superficial digital flexor tendon, whereby the tendon slides medially or laterally off the point of the tarsus. This injury occurs spontaneously during vigorous activity. This is a severe injury that if left unrepaired will result in a severe lameness. The longer the condition occurs and is unrepaired, the more likely for build up of fibrous/scar tissue and possible failure. Medical management with casts, splints or bandages alone is usually unsatisfactory. After 2-3 weeks of confinement and inactivity of the limb by placing the limb in a bandage and splint, the patient may receive controlled activity. This disease process is overrepresented in collie and Sheltie breeds.

The undersigned owner or authorized agent of admitted patient _______________________ hereby authorize the admitting veterinarian (and his/her designated associates or assistants) to administer such treatment as is necessary to perform the below-mentioned procedure. The nature of the procedure(s) has been explained to
me and no guarantee has been made as to results or cure. I understand that there may be risk involved in these procedures.

I consent to the administration of such anesthetics or tranquilizers as are necessary.

Anesthetic Risks: (Although every effort is made to make anesthesia as safe as possible including vital sign monitoring and use of the most up to date anesthetic agents and equipment, I understand that anesthesia carries inherent risks) The incidence of complications from anesthesia are extremely low and we do not anticipate any complications in your pet but on rare occasions the following can occur:

1. Allergic reaction to the anesthetic agents
2. Heart rhythm abnormalities
3. Untoward reactions to the gas including drops in blood pressure or respiratory difficulties
4. Just like in humans, on very rare occasions, general anesthesia can result in death.

Procedure: Superficial digital flexor tendon luxation repair, bandage, splint

Surgical Risks:

1. Some species, particularly Shelties, can break down in the opposite limb shortly after the first injury.
2. Failure of the tendon repair can occur if proper post-operative care is not followed by the owner.
3. Infection
4. Bandage wounds or sores due to inappropriate restriction during bandage/cast placement period.

Strict adherence to post-surgical care and medicating of your pet will minimize these potential complications and serious problems are very uncommon in most cases.
